How is pharmacologic stress testing done? Pharmacologic stress testing can be done in a clinic, a caregiver's office, or in a hospital. An IV line is placed in a vein of your arm. Electrodes (sticky patches) are stuck on your chest. Hair may need to be removed to help the electrodes stick to your skin. The electrodes will be attached to wires that send the electrical activity of your heart to the electrocardiogram (ECG) monitor.

Forced degradation studies (FDS) are essential in the development of stability indicating methods to gain understanding of the intrinsic stability characteristics of a Drug Substance (DS). Performance of stress studies under various conditions allows prediction of the possible degradants that may be obtained during registrational long term stability studies (LTSS).

~~Impact from the Recent Issuance of ANVISA Resolution RDC ...~~

Forced degradation (stress testing) studies are fundamental to the developing stability-indicating methods as part of the overall analytical control strategy. Stress testing studies conducted on both the drug substance and product are useful for gaining an understanding of the degradation chemistry of a drug.
